mooreVIEW — Product Description

Proactive operations. Portable everywhere.

A company powered by The Purple Standard · purple-standard.com

Document version: 1.2 · 2026-07-26

Part of The Purple Standard

At [The Purple Standard](https://purple-standard.com), we are leading the next generation of field services in Florida. Through strategic investment and shared support, our companies modernize their trades and expand their reach to serve businesses, municipalities, communities, and homeowners with lasting value and reliability.

mooreVIEW is one of the companies **powered by The Purple Standard** — distinct in its service (industrial automation, condition monitoring, and maintenance software), but united with every sister company by **The Purple Standard Pledge**:

- Clear communication
- Technology and solutions driven
- Professionalism in action
- Exceeding expectations

Our flagship sister company, **ACE Septic & Waste**, has become instantly recognizable across the Tampa Bay area with its bold purple trucks. That same standout identity carries through to each of our companies: **distinct in their services, but united by our pledge**.

While sister companies hold the licenses and credentials for septic, electric, well systems, and on-site field work — commercial, municipal, residential, and environmental — **mooreVIEW** provides the technology layer those trades use to modernize: fleet visibility, predictive maintenance, portable project files, and work orders scheduled **before** the emergency call.

Sister field-service focus	mooreVIEW technology role
Septic, lift station, and wastewater service	Level, pump, and ATU monitoring → proactive CMMS
Pool and aquatic service	Filter, chemistry, pump health → planned service before failure
HVAC and convenience retail	Comfort drift and cold-chain alarms → tune before complaint or product loss
Well and pump service	Dry-run and yield trends → scheduled pull before burn-up
Electrical and on-site work	Alarm context, historian, and compliance evidence
Fleet operations across Florida	Parc MQTT hub, multi-site Cloud Studio, portable .est projects

Learn more about the portfolio at purple-standard.com — or contact The Purple Standard to inquire about integrated field services and becoming a Purple Standard company.

At a glance

mooreVIEW is an integrated industrial automation, condition monitoring, and maintenance platform for mechanical and environmental assets — lift stations, septic and wastewater, **residential and commercial pools, residential and commercial HVAC, convenience stores**, refrigeration, wells and pumps, and institutional campuses. It is the proactive, portable software platform in **The Purple Standard** family of companies.

Most facilities still run **reactive**: equipment fails, someone notices, a truck rolls, and downtime cost hits the budget. mooreVIEW inverts that model. It **sees degradation early, turns signals into planned work**, and **moves with you** — from a laptop in the office to an edge appliance in the mechanical room to a multi-site cloud dashboard — without re-engineering the project every time.

One line: mooreVIEW turns distributed mechanical assets from breakdown businesses into condition-based, portable, contracted monitoring businesses.

The reactive trap

Across the industries mooreVIEW serves, the dominant operating model looks the same:

What happens today	What it costs
Assets run until failure or complaint	Emergency dispatch, overtime, spoiled product, overflow, resident harm
Alarms are local dialers or siloed OEM apps	No fleet view, no history, no work order context
“Preventive” maintenance is calendar guesswork	Parts and labor spent whether the asset needs it or not
Every site is a custom snowflake	Knowledge trapped on one PC; handoffs mean starting over

Competitors optimize the **reactive loop** — faster dispatch, cheaper controllers, better parts. mooreVIEW changes the **model**: detect drift before catastrophe, schedule the fix on your terms, and carry the entire project configuration wherever the work happens.

What mooreVIEW is

mooreVIEW is a **single platform** that combines what operators, integrators, and service firms usually buy in fragments:

Capability	Role
------------	------

Structured Text (ST) runtime	Edge logic on pumps, compressors, blowers, wells, pool filtration and chemistry , and plant equipment — detect leading indicators, not only hard faults
Tag database & I/O drivers	Modbus, MQTT, serial, HTTP APIs — one tag model from field to historian
Integrated HMI	Operator screens built in-product; no separate SCADA license stack
Historian & trends	MongoDB-backed tag history for capital planning and root-cause analysis
MQTT Parc fleet hub	Multi-site visibility for contractors, utilities, OEMs, and campuses
Predictive maintenance (PdM)	Health index, failure forecast, remaining useful life (RUL) — days or weeks before alarm
Integrated CMMS	Work orders, PM schedules, assignees — alarm, PdM, and calendar triggers in one app
IP cameras & vision AI	ONVIF discovery, live streaming, snapshots, optional edge or host inference
Training & certification	Built-in IoT Condition-Based Monitoring curriculum (F2) for operators and integrators

mooreVIEW ships as **MVP Suite** on Windows and Linux (all-in-one desktop appliance), **Cloud SaaS** for multi-tenant hosted operations, **IoT-Link** profiles for embedded edge gateways, and **MV Client** for lightweight remote operator UI — all from one codebase, one API contract, one project format.

Proactive, not reactive — the mooreVIEW difference

North star: mooreVIEW is proactive. PdM detects degradation early; CMMS schedules the fix **before** failure — not after an alarm, overflow call, or warm-box discovery.

Three layers of action

Layer	Timing	mooreVIEW trigger	Outcome
Predictive (PdM)	Days to weeks before failure	Failure forecast warning / critical / failed	Proactive PM work order — planned visit, parts on the truck
Preventive (PM)	Calendar interval	PM schedule due	Routine service without waiting for symptoms
Reactive (alarm)	Condition already out of limits	Tag alarm transition	Urgent work order — last line of defense , not the strategy

All three coexist. The difference is **where you live on the timeline**. mooreVIEW customers aim to spend most of their maintenance budget on the first two rows — and treat alarms as the safety net, not the business model.

Proactive workflow (end to end)

- Edge sensing + historian
- PdM feature windows (vibration, runtime, starts, temperature bands)

→ Failure forecast (ok → warning → critical → failed)

→ CMMS proactive PM work order (source: pdm)

→ Technician completes work on a planned route

→ Service history feeds back into the next forecast

When a PdM-sourced work order is completed, mooreVIEW appends service history to the asset context — so the **next** forecast reflects the repair. That closed loop is what turns one saved pump into a fleet learning system.

Reactive vs proactive — by industry

Industry	Reactive (competition)	Proactive (mooreVIEW)
Lift stations	Autodialer at overflow	Level and pump trends → intervene before SSO
Refrigeration / convenience store	Discover warm boxes after loss	Walk-in/rack trends, short-cycle → planned WO
HVAC — residential	Comfort complaint → truck	Band drift before occupant call
HVAC — commercial	RTU fail on arrival	Runtime/amp anomalies → tune before call
Pool — residential	Green pool / pump dead on visit	Filter/chemistry/backwash advisories
Pool — commercial	Guest-event or health-dept crisis	Pump health, chemistry, schedule compliance
Septic / ATU	Fail at inspection or odor event	Blower, UV, pump health → compliance route
Wells & pumps	Emergency pull after burn-up	Dry-run and yield trends → scheduled pull
Institutional	Survey scramble, fragmented apps	Campus ops picture + evidence before outage

Pools — residential & commercial

Pool service is one of mooreVIEW’s core verticals — not an add-on. **~10M residential pools** and thousands of **commercial aquatic sites** (hotels, HOAs, aquatic centers, assisted-living campuses) run on the same reactive model: green water, dead pump, or a health-department event triggers the truck. mooreVIEW makes pool operations **proactive and portable**.

What mooreVIEW monitors

Signal	Residential	Commercial
Filter pump	Runtime, amps, flow, VFD health	Multi-pump lead/lag, imbalance
Chemistry	ORP, salt/chlorinator, pH bands	IntelliChlor / dosing compliance
Backwash & turnover	Filter pressure, schedule adherence	Day/night turnover sizing, spa cycles
Heater & aux	Heat pump / gas heater faults	Shared-bus Pentair / Speck equipment
Fleet view	Contractor route across homeowner accounts	Property-manager portfolio Parc

Pool product & project packs

Pack	Description
iot-link-pool appliance	Edge profile for pool mechanical rooms — dual RS-485 (Speck pump, Pentair bus), Opta MQTT I/O, pool overview HMI
Pool .est project	ST program 30_pool_controller.st, filter schedule HMI, chemistry faceplates, backwash and lighting composites
Assisted-living demo	Campus pool room, filter schedule, and mechanical integration in bundled assisted-living project
Contractor Parc	MQTT fleet hub — one dashboard for every pool on the service route

Typical proactive outcomes:

- **Backwash or pump service scheduled** from pressure trend — before green pool or motor failure
- **Chemistry drift caught early** — before guest complaint or health inspection
- **Turnover schedule compliance** documented in historian — not guesswork on the route sheet
- **Portable .est** moves with the account when the homeowner changes service companies

Pool pricing (list)

Tier	Assets	One-time	Renewal	Year-1 total
Residential pool	Single-pool homeowner route	\$1,500	\$18/mo (+ \$3/mo cell)	\$1,752
Commercial pool	Hotel, HOA, aquatic center	\$2,500	\$25/mo (+ \$3/mo cell)	\$2,836

PdM and CMMS are included in renewal — filter pump wear and chemistry anomalies can open **proactive PM work orders** before the seasonal crisis call.

Portable everywhere — one project, any deployment

Portability is not an afterthought in mooreVIEW. It is how integrators **win repeat business**, how service firms **standardize routes**, and how asset owners **keep continuity** when staff or vendors change.

.est — the portable project file

Every mooreVIEW site is captured in a **portable .est project archive** (`.est.zip` / `.mvbundle`). One file holds:

- ST program and scan configuration
- Tag database, drivers, and I/O map
- HMI screens and faceplates
- Alarm limits and notification profiles
- Camera inventory and vision AI settings
- PdM asset context, service history, and CMMS data
- Site plan and MV-Draw layout (where used)

Open on a laptop. Save. Email to the cloud team. Deploy to the edge appliance. Hand off to the next contractor. Same project, same behavior — no silent re-commissioning.

Typical portability wins:

Scenario	How .est helps
Site handoff	Owner receives a complete, documented configuration — not a password on a mystery PC
Version control & backup	Named project snapshots; rollback after a bad change
Fleet standardization	One “gold” lift-station or refrigeration template cloned to dozens of sites
Office ↔ field	Engineer on MVP Suite; operator on MV Client or Cloud Studio — same API, same tags
Training & demos	Bundled vertical projects (duplex lift station, assisted living, pool, HVAC, c-store) ship ready to run

Deploy where the work happens

mooreVIEW uses **one codebase** with deployment mode controlled by environment — not separate products that diverge over time.

Deployment	Best for	Portability note
MVP Suite (appliance)	Plant-floor PC, offline-capable site	Full Studio at <code>localhost:3090</code> ; <code>.est</code> is the unit of backup and migration

IoT-Link (edge Linux)	Remote mechanical rooms, cellular gateways	Same runtime stack; field buses stay on the LAN at the edge
Cloud SaaS	Multi-customer hosted operations	Tenant workspace + site agents; projects sync via export/import
Cloud hub	Central MQTT ingest and fleet Parc	Edge appliances uplink telemetry; configuration still lives in portable projects
MV Client	Operator UI only	Points at any mooreVIEW API — thin client, portable HMI experience

Rule that protects portability: anything requiring LAN broadcast, serial COM, or subnet sweep runs on the **edge appliance**. Cloud adds fleet scale; edge keeps field integrity. The **project file** bridges both.

Edge AI that travels with the asset

mooreVIEW supports predictive signals from **device edge AI** (Opta firmware), **host inference** (ONNX on the appliance), and **historian feature builds** — mapped to the same PdM asset IDs in the project. Swap a pump motor, update service history in CMMS, rebuild features: the forecast reflects reality because context lives **in the project**, not in a vendor’s closed cloud silo.

Platform architecture (plain language)

mooreVIEW is a **monolithic Node application** with an integrated Express API, EJS dashboard, scan engine, and in-process event bus — designed for reliability on a single-site appliance and scale-out to cloud SaaS.

On alarm transition, mooreVIEW emits a structured event (`alarm:transition`) — consumed in-process on the appliance and publishable to external CMMS via MQTT Integration v1. PdM proactive checks run on nightly batch, manual **Build features now**, or **Run proactive CMMS check**.

Integrated CMMS — maintenance without another silo

mooreVIEW includes a **built-in CMMS** (`/cmms`) on appliance and cloud — no separate maintenance product required for the core proactive workflow.

Source	Trigger	Typical priority
PdM forecast	Pending failure (warning ≤ 30 days RUL; critical ≤ 7 days)	High $\rightarrow$ urgent
Alarm	Tag out of limits	Normal $\rightarrow$ high
PM schedule	Calendar due	Normal
Manual	Operator or dispatcher	Normal

Overview dashboard shows open work orders, overdue PM, and counts by source — so managers see at a glance whether the fleet is running **proactive** (PdM/PM) or **firefighting** (alarm-only).

External CMMS systems can **subscribe** to mooreVIEW-published MQTT alarm topics (mooreVIEW remains the authoritative alarm source). Integrated CMMS is the default for greenfield; MQTT bridge extends brownfield.

Predictive maintenance — fix before breakdown

PdM in mooreVIEW is production-oriented, not a dashboard widget:

- **Asset mapping** — motor/pump/fan/compressor types, location class, install and service history
- **Feature windows** — time-series features from historian and edge AI ingest
- **Health index & forecast** — ok, warning, critical, failed with RUL estimates
- **Proactive CMMS** — one open WO per asset, deduped and escalated as severity worsens
- **Reports** — per-asset PdM PDF, scheduled report batch, Mongo report templates

Settings (`Issue CMMS PM on pending PdM failure`) default **on** — because the product thesis is proactive. Alarms remain enabled as the last line.

Duplex lift-station and **pool controller** deployments demonstrate the full loop: lag pump wear or filter pressure drift, location-aware sim rates, proactive PM work orders weeks before high-level alarm or green-pool event — documented in training, simulation studies, and the `iot-link-pool` appliance profile.

Market revenue potential (directional)

Horizon	Metric	Target
Per site (residential pool)	Year-1 list revenue	~\$1,752
Per site (commercial pool)	Year-1 list revenue	~\$2,836

Pools (res + commercial)	5-year recurring ARR potential	\$5 – 14M
Year 1 (portfolio)	~237 sites · total revenue	~\$550K – \$600K
Year 3 (portfolio)	~1,500 cumulative sites · total revenue	~\$3.5M
5-year (all verticals)	Recurring ARR ceiling	\$50 – 120M

Serviceable US wedge for lift/ATU/wastewater alone: ~**\$400M/yr** (sites without full SCADA). Convenience retail, pools, and HVAC contractor routes expand SAM materially beyond wastewater.

Who mooreVIEW is for

Buyer	Proactive outcome	Portability outcome
Asset owners (utilities, food service, campuses)	Fewer emergencies; SLA and compliance evidence	One project file per site; vendor-independent continuity
Service & monitoring contractors	Monitoring contracts + planned routes, not only T&M breakdowns	Clone templates across routes; fleet Parc view — pool routes, HVAC PM, lift fleets
OEMs & panel shops	Ship connected panels, not dialer-only skids	White-label appliance profiles; embed proactive monitoring
Integrators & commissioners	Deliver CBM programs with training built in	.est handoff; MVP Suite ↔ Cloud parity

Deployment & packaging

Package	Description
mooreVIEW MVP Suite	All-in-one Windows/Linux installer — ST, HMI, historian, Parc, PdM, CMMS
IoT-Link appliance	Edge Linux image for remote sites (cellular, MQTT uplink)
Cloud SaaS	Multi-tenant hosted Studio on port 3100 — org login, sites, agent hub
Vertical project packs	Pre-wired .est for pools (<code>iot-link-pool1</code>), lift stations, HVAC, convenience stores, assisted living, septic, and more
Training curriculum	IoT CBM course (13 modules) + mooreVIEW labs (M0–M15) in-product

Proof mooreVIEW is working

A deployment is truly **proactive** when:

- Alarms fire on **leading** indicators — drift, imbalance, abnormal starts — not only hard faults
- Work orders are created **before** the customer complaint or overflow call
- Partners sell **monitoring agreements**, not only emergency dispatch
- Reference stories cite **avoided** failure, food loss, SSO, or survey findings — not “faster response to failure”
- Project files move between office, edge, and cloud **without** re-commissioning

Summary

	Reactive industry default	mooreVIEW
Timing	Fix after failure	Fix on forecast, before failure
Visibility	Single-site silo	Fleet Parc + historian
Maintenance	Voicemail → truck	PdM → CMMS → planned route
Configuration	Trapped on one PC	Portable .est project everywhere
Deployment	OEM lock-in	Appliance, edge, cloud, client — one platform

mooreVIEW: proactive operations you can carry anywhere.
